> WHOAMI

Red team operator and cyber threat intelligence investigator. Multidisciplinary background converged on one objective: mastery of offensive security. Focused on adversary emulation, CTI-led threat hunting, ransomware and malware investigation, and red teaming of AI and agentic systems.

> ARSENAL

- Red team / adversary emulation
- Cyber threat intelligence (CTI)
- Malware analysis & reverse eng.
- Exploit development
- Ransomware investigation
- AI / agentic red teaming
- RAG poisoning & prompt injection

> LANG

- English — Fluent
- Urdu — Native

01 EXPERIENCE

Cyber Threat Intelligence Investigator / Red Teamer 2024 – Present
Resecurity // Los Angeles, USA · operating from Pakistan

- > Run proactive, intelligence-led red team engagements to surface threats before they materialise.
- > Investigate and track ransomware operations and cybercrime infrastructure as part of CTI work.
- > Contributed to an engagement targeting the BlackLock ransomware operation.
- > Collaborate with a wider CTI and red team unit on adversary tracking and disruption.

02 FOCUS AREAS

Adversary emulation	Malware analysis & RE
Exploit development	Ransomware investigation
AI / agentic red teaming	RAG poisoning
Prompt-injection testing	Proactive threat hunting

03 CERTIFICATIONS

McAfee CCII — Certified Cyber Intelligence Investigator
CMMI — Capability Maturity Model Integration

04 SELECTED PROJECTS

BlackLock ransomware engagement

- > Involved in an engagement against the BlackLock ransomware operation.

AI / agentic red teaming

- > Testing of AI and agentic systems, including RAG-poisoning and prompt-injection techniques.

Global credential-harvesting campaign analysis

- > Discovered and documented a large-scale credential-harvesting operation against network perimeter infrastructure — 430,000+ firewalls across 194 countries, 110M+ credentials harvested, a CISA emergency alert, and a confirmed breach at a NATO-aligned defense contractor.

GitLab vulnerability disclosure – Report C2MAB-06

- > Found and responsibly disclosed an unpatched ambiguous branch/tag reference vulnerability in GitLab's Repository Files and Compare REST APIs — a sibling gap in a fix GitLab had already shipped for CVE-2025-12506. Live-verified against production; currently under coordinated disclosure.
